SG 2.6-114
Boosting production at sites with medium and high winds
Technology with extensive experience and validation

SG 2.6-114: intelligent evolution to boost production in medium and high winds

One of the key aspects to Siemens Gamesa’s success is the continuous development of new and advanced products adapted to the business case of every customer. We strive to provide the best technological solutions for each project, while driving down the LCoE.

For this reason, we offer an optimized, streamlined catalog of proven solutions adapted to every type of site and condition, backed by:

- Our reputation as a trusted and stable partner (+90 GW installed worldwide).
- A proven track record spanning over 35 years that makes Siemens Gamesa a benchmark for wind projects.
- The recognition of the wind power sector.
Maximum reliability
The SG 2.6-114 wind turbine is integrated into the Siemens Gamesa 2.X platform, a benchmark in the market thanks to its excellent capacity factor and high profitability. Designed for moderate- and high-wind sites, this model complements the Siemens Gamesa 2.1 MW offer in projects requiring higher nominal power. Boasting a 114-meter rotor, various tower options (from 63 to 125 meters) and increased nominal power of up to 2.625 MW, this turbine guarantees maximum efficiency at a reduced Levelized Cost of Energy.

It is a natural evolution of the SG 2.1-114 model and inherits most of the technologies, components and subsystems while incorporating the necessary modifications to achieve increased power. The main features of the SG 2.6-114 turbine include:

- Pitch and variable speed technology to maximize energy production.
- Siemens Gamesa active yaw system for ensuring optimal adaptation to complex terrain.
- Siemens Gamesa SMP: predictive maintenance system.
- DinoTails® Next Generation serrated trailing edges and Siemens Gamesa NRS® control system to minimize the noise emission levels.
- Siemens Gamesa WindNet® PRO: remote control and monitoring system with Web access.

Higher energy output
By incorporating a 56-meter blade, designed by Siemens Gamesa using cutting-edge technologies and specifically reinforced for sites with moderate and high winds, along with a 2.625 MW generator, we have been able to increase the turbine yield by over 13% and achieve a significant reduction in the Levelized Cost of Energy compared to the SG 2.1-114 model. This makes the SG 2.6-114 turbine one of the most efficient and cost-effective solutions available to our customers.

Versatility and extensive experience
Endorsed by its reliability, with an average fleet availability greater than 98%, and by its extensive experience, Siemens Gamesa 2.X stands out for its versatility and maximum performance at all locations and in all wind conditions. Its range of rotors and tower heights (63-153 meters) combined with different environmental options creates an excellent proposal for harvesting maximum energy from the wind with the greatest efficiency.
